June 2021

1 Implementation and Results

In this pdf we have written everything based on our hardware implementation.

1.1 Environment Setup

2G Implementation :

First Ubuntu version 16.04/18.04 needs to be installed as this version is more compatible with the software needed to implement 2G network. Git version needs to be at least newer than 1.8.2. Update commands for git is shown below:-

\$ sudo apt-get install software-properties-common python-software-properties

```
tasin@tasin-Inspiron-3558:~$ sudo apt-get install software-properties-common python-software-properties
Reading package lists... Done
Building dependency tree
Reading state information... Done
The following additional packages will be installed:
  aptdaemon python-apt python-pycurl python3-aptdaemon
  python3-aptdaemon.gtk3widgets python3-aptdaemon.pkcompat
  python3-software-properties software-properties-gtk
Suggested packages:
  python-apt-dbg python-apt-doc libcurl4-gnutls-dev python-pycurl-dbg
  python-pycurl-doc
The following NEW packages will be installed:
  python-apt python-pycurl python-software-properties
The following packages will be upgraded:
  aptdaemon python3-aptdaemon python3-aptdaemon.gtk3widgets
  python3-aptdaemon.pkcompat python3-software-properties
  software-properties-common software-properties-gtk
7 upgraded, 3 newly installed, 0 to remove and 425 not upgraded.
Need to get 420 kB of archives.
After this operation, 930 kB of additional disk space will be used.
Do you want to continue? [Y/n] y

Reading package lists... Done
tasin@tasin-Inspiron-3558:~$ sudo apt-get install git
Reading package lists... Done
Building dependency tree
Reading state information... Done
The following additional packages will be installed:
  git-man liberror-perl libpcre2-8-0
Suggested packages:
  git-daemon-run | git-daemon-sysvinit git-doc git-el git-email git-gui gitk
  gitweb git-cvs git-mediawiki git-svn
The following NEW packages will be installed:
  git git-man liberror-perl libpcre2-8-0
0 upgraded, 4 newly installed, 0 to remove and 425 not upgraded.
Need to get 8,177 kB of archives.
After this operation, 48.5 MB of additional disk space will be used.
Do you want to continue? [Y/n] y
```

Next, the github repository needs to be cloned by running

```
$ git clone https://github.com/Range Networks/dev.git
```

```
git
Cloning into 'dev'...
remote: Enumerating objects: 158, done.
remote: Total 158 (delta 0), reused 0 (delta 0), pack-reused 158
Receiving objects: 100% (158/158), 44.87 KiB | 105.00 KiB/s, done.
Resolving deltas: 100% (99/99), done.
```

This will save the downloaded files on a folder named ‘dev’ on /home, running

```
$cd dev
```

We will move to the dev folder. Now running the clone.sh script will download all the components automatically.

```
$/clone.sh
```

Now to install all the components and all the dependencies including GNU-radio, UHD etc. We need to run the build.sh script along with the radio being used. Here we are using the USRP B200.

`$/build.sh B200`

```
AN/*' -printf '%P\0' | LC_ALL=C sort -z | xargs -r0 md5sum > DEBIAN/md5sums) >/dev/null
    chmod 0644 debian/range-configs/DEBIAN/md5sums
    chown 0:0 debian/range-configs/DEBIAN/md5sums
dh_builddeb
    find debian/range-configs -regex .*\\.svn.* -or -regex .*\\.git.* |
xargs rm -rf
    dpkg-deb --build debian/range-configs ..
dpkg-deb: warning: conffile name '/etc/bind/named.conf.options' is duplicated
dpkg-deb: warning: ignoring 1 warning about the control file(s)
dpkg-deb: building package 'range-configs' in '../range-configs_5.1-master_all.d
eb'.
# nothing to do
    dpkg-genchanges >../range-configs_5.1-master_amd64.changes
dpkg-genchanges: including full source code in upload
    dpkg-source --after-build system-config
dpkg-buildpackage: full upload; Debian-native package (full source is included)
cd ..
mv range-configs_5.1-master_all.deb range-configs_5.1-master_amd64.changes range
-configs_5.1-master.dsc range-configs_5.1-master.tar.gz BUILDS/2020-11-10--13-15
-24
# - done
```

Now we will use the dpkg to install the packages

`$ sudo dpkg -i BUILDS/timetamp/*.deb`

```
      D      : show the differences between the versions
      Z      : start a shell to examine the situation
The default action is to keep your current version.

Processing triggers for ufw (0.35-0ubuntu2) ...
```

GSM configuration:

First we need to connect the USRP B200 with the computer using USB 3.0 connection port. The following command is used to make sure the device is properly connected and also upload the image and FPGA image to the SDR

```
$ uhd_usrp_probe
```

Next, we need to start up the network. Running OpenBTS automatically runs an instance of the transceiver and data is then transferred between OpenBTS and the transceiver using a UPD (User Data gram Protocol) socket.

```
$ cd/ OpenBTS
```

```
$ sudo./OpenBTS
```

Configuring the band and the channel commands,

```
OpenBTS>> configGSM.Radio.Band <desiredband>
```

```
OpenBTS>> configGSM.Radio.c0 <desiredchannel>
```

```
OpenBTS>> devconfigGSM.Radio.RxGain10
```

After that a handset needs to be connected to the network. For that we need to know the IMSI (International Mobile Subscribe Identity) of our SIM. We now start the System IP authentication server command by writing

```

tasin@tasin-Inspiron-3558:/usr/share$ uhd_usrp_probe; GNU C++ version 5.3.1 20151219; Boost_105800; UHD_003.009.002-0-unknown
-- Loading firmware image: /usr/share/uhd/images/usrp_b200_fw.hex...
-- Detected device: B200
-- Loading FPGA image: /usr/share/uhd/images/usrp_b200_fpga.bin... done
-- Operating over USB 3.
-- Detecting internal GPSDO... No GPSDO found
-- Initialize CODEC control...
-- Initialize Radio control...
-- Performing register loopback test... pass
-- Performing CODEC loopback test... pass
-- Asking for clock rate 16.000000 MHz...
-- Actually got clock rate 16.000000 MHz.
-- Performing timer loopback test... pass
-- Setting master clock rate selection to 'automatic'.

Device: B-Series Device

```

In order to manually add a subscriber to the network we can use nmcli.py Node-Manager which is in dev/NodeManager.

```
$ cd dev/NodeManager
```

```
tasin@tasin-Inspiron-3558:~/dev/NodeManager$ ./nmcli.py sipauthserve subscribers create "nahid" IMSI470074204057773 \224455
raw request: {"command":"subscribers","action":"create","fields":{"name":"nahid","imsi":"IMSI470074204057773","msisdn":"224455","k":
raw response: {
  "code" : 200,
  "data" : "both ok"
}
tasin@tasin-Inspiron-3558:~/dev/NodeManager$
```

```
$ ./nmcli.py sipauthserve subscribers create name imsi msisdn
```

```
tasin@tasin-Inspiron-3558:~/dev/NodeManager$ ./nmcli.py sipauthserve subscribers create "nahid" IMSI470074204057773 \224455
raw request: {"command":"subscribers","action":"create","fields":{"name":"nahid","imsi":"IMSI470074204057773","msisdn":"224455","k":""}}
raw response: {
  "code" : 200,
  "data" : "both ok"
}
tasin@tasin-Inspiron-3558:~/dev/NodeManager$ ./nmcli.py sipauthserve subscribers create "tasin" IMSI470039206246447 \224456
tasin@tasin-Inspiron-3558:~/dev/NodeManager$ ./nmcli.py sipauthserve subscribers create "tasin" IMSI470039206246447 \224456
raw request: {"command":"subscribers","action":"create","fields":{"name":"tasin","imsi":"IMSI470039206246447","msisdn":"224456","k":""}}
raw response: {
  "code" : 200,
  "data" : "both ok"
}
tasin@tasin-Inspiron-3558:~/dev/NodeManager$
```

If we use the below command we will be able to see the table of the subscribers connected to the network.

OpenBTS tmsis

```
OpenBTS> tmsis
IMSI          TMSI  IMEI          AUTH  CREATED  ACCESSED  TMSI_ASSIGNED
470074204057773 -    863728043914950 1      8m      141s      0
470039206246447 -    353679112101770 1      7m      267s      0

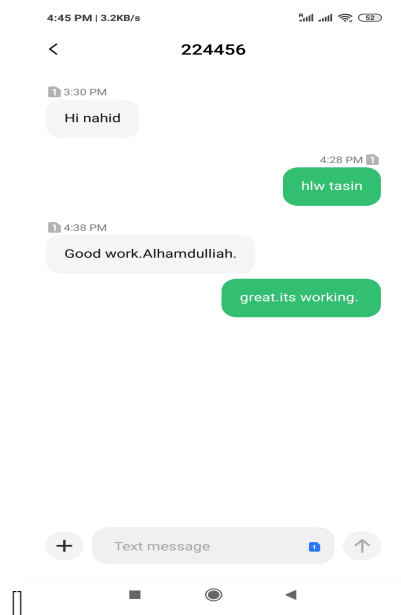

OpenBTS> █
```

\$ sudo /OpenBTS/smqueue

```
tasin@tasin-Inspiron-3558:~$ sudo /OpenBTS/smqueue
[sudo] password for tasin:
ALERT 4437:4437 2021-03-25T11:36:39.4 smqueue.cpp:2798:main: smqueue (re)star
smqueue logs to syslogd facility LOCAL7, so there's not much to see here
█
```

OUTPUT:

Messaging and Dialing:

4G Implementation :

Firstly, Device identification and connection may be required. Manually write product id, vendor id etc in uhd folder. Then, we have to install UHD drivers by these commands. \$ cd

```
$ git clone https://github.com/EttusResearch/uhd.git ;
```

```
$ cd uhd
```

```
$ git checkout UHD-3.15
```

```
$ mkdir host/build ;
```

```
$ cd host/build
```

```
$ cmake ../
```

```
$ make
```

```
$ make test
```

```
$ sudo make install
```

```
$ sudo ldconfig
```

Secondly, we have to install FGPA images for current device. In our case it is USRP b200.

```
$ sudo uhd_images_downloader
```

```
tasin@tasin-Inspiron-3558:~$ uhd_usrp_probe
linux; GNU C++ version 5.3.1 20151219; Boost_105800; UHD_003.009.002-0-unknown

-- Loading firmware image: /usr/share/uhd/images/usrp_b200_fw.hex...
-- Detected Device: B200
-- Loading FPGA image: /usr/share/uhd/images/usrp_b200_fpga.bin... done
-- Operating over USB 2.
-- Detecting internal GPSDO.... No GPSDO found
-- Initialize CODEC control...
-- Initialize Radio control...
-- Performing register loopback test... pass
-- Performing CODEC loopback test... pass
-- Asking for clock rate 16.000000 MHz...
-- Actually got clock rate 16.000000 MHz.
-- Performing timer loopback test... pass
-- Setting master clock rate selection to 'automatic'.

-----
Device: B-Series Device
-----
Mboard: B200
revision: 4
product: 1
serial: F543A5
FW Version: 8.0
FPGA Version: 13.0

Time sources: none, internal, external, gpsdo
Clock sources: internal, external, gpsdo
Sensors: ref_locked

-----
RX DSP: 0
Freq range: -8.000 to 8.000 MHz

-----
RX Dboard: A
-----
```

Next, we have to install dependencies for srsLTE and usrp b200 by these commands
\$ sudo apt-get install cmake libfftw3-dev libmbedtls-dev libboost-program-options-dev libconfig++-dev libsctp-dev
Then, let's see our current network by "route" commands. We will be able to show only one network by our ISP if our PC is connected to WIFI

```
tasin@tasin-Inspiron-3558:~$ route
Kernel IP routing table
Destination    Gateway         Genmask         Flags Metric Ref    Use Iface
default        192.168.0.1     0.0.0.0         UG    600    0      0 wlp6s0
link-local     *              255.255.0.0     U     1000   0      0 wlp6s0
192.168.0.0    *              255.255.255.0   U     600    0      0 wlp6s0
tasin@tasin-Inspiron-3558:~$
```

Now, we have to implement another network by srsLTE which gives us a network address. So firstly, we have to install srsLTE by source
\$ cd
\$ git clone https://github.com/srsLTE/srsLTE.git

```
tasin@tasin-Inspiron-3558:~$ cd ~
tasin@tasin-Inspiron-3558:~$ git clone https://github.com/srsLTE/srsLTE.git

```

```
$ sudo make install
```

Sometimes, it required some optional Configurations like file Merge or create copy files for testing purpose

Then , Lets Run srsLTE.It will initialize and start all network components,packet cores for LTE network.

```
$ cd /srsLTE/srsepc
```

```
$ sudo srsepc epc.conf
```

In another terminal, we have to run our base station by this command.It will

```

--- Software Radio Systems LTE eNodeB ---

Reading configuration file enb.conf...
WARNING: cpu0 scaling governor is not set to performance mode. Realtime pr
e before running the application.

Built in Release mode using commit 45486b6e2 on branch master.

Opening 1 channels in RF device=default with args=default
Opening USRP channels=1, args: type=b200,master_clock_rate=23.04e6
-- Detected Device: B200
-- Operating over USB 2.
-- Initialize CODEC control...
-- Initialize Radio control...
-- Performing register loopback test... pass
-- Performing CODEC loopback test... pass
-- Asking for clock rate 23.040000 MHz...
-- Actually got clock rate 23.040000 MHz.
-- Performing timer loopback test... pass
Setting frequency: DL=2680.0 Mhz, UL=2560.0 MHz for cc_idx=0

==== eNodeB started ====
Type <t> to view trace

```

Now using Route command, we will be able to show multiple networks. Network

address is 172.16.0.0 and interface name srs_spgw_sgi. From this network, we will give default gateway first ip address 172.16.0.1 for the base station

```
tasin@tasin-Inspiron-3558:~$ route
Kernel IP routing table
Destination Gateway Genmask Flags Metric Ref Use Iface
default 192.168.0.1 0.0.0.0 UG 600 0 0 wlp6s0
link-local * 255.255.0.0 U 1000 0 0 wlp6s0
172.16.0.0 * 255.255.255.0 U 0 0 0 srs_spgw_sgi
192.168.0.0 * 255.255.255.0 U 600 0 0 wlp6s0
tasin@tasin-Inspiron-3558:~$
```

Finally , we test our network. As a primary testing, we ping srsLTE network which is working as a BTS for USRP b200 (Default gateway): ping 172.16.0.1

```
tasin@tasin-Inspiron-3558:~$ 172.16.0.1
172.16.0.1: command not found
tasin@tasin-Inspiron-3558:~$ ping 172.16.0.1
PING 172.16.0.1 (172.16.0.1) 56(84) bytes of data.
64 bytes from 172.16.0.1: icmp_seq=1 ttl=64 time=0.021 ms
64 bytes from 172.16.0.1: icmp_seq=2 ttl=64 time=0.047 ms
64 bytes from 172.16.0.1: icmp_seq=3 ttl=64 time=0.047 ms
64 bytes from 172.16.0.1: icmp_seq=4 ttl=64 time=0.048 ms
64 bytes from 172.16.0.1: icmp_seq=5 ttl=64 time=0.046 ms
64 bytes from 172.16.0.1: icmp_seq=6 ttl=64 time=0.046 ms
64 bytes from 172.16.0.1: icmp_seq=7 ttl=64 time=0.048 ms
64 bytes from 172.16.0.1: icmp_seq=8 ttl=64 time=0.047 ms
64 bytes from 172.16.0.1: icmp_seq=9 ttl=64 time=0.032 ms
64 bytes from 172.16.0.1: icmp_seq=10 ttl=64 time=0.047 ms
